1985

The National Bureau of Standards¹ was established by an act of Congress on March 3, 1901. The Bureau's overall goal is to strengthen and advance the nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau's technical work is performed by the National Measurement Laboratory, the National Engineering Laboratory, the Institute for Computer Sciences and Technology, and the Institute for Materials Science and Engineering.

The National Measurement Laboratory

Provides the national system of physical and chemical measurement; coordinates the system with measurement systems of other nations and furnishes essential services leading to accurate and uniform physical and chemical measurement throughout the Nation's scientific community, industry, and commerce; provides advisory and research services to other Government agencies; conducts physical and chemical research; develops, produces, and distributes Standard Reference Materials; and provides calibration services. The Laboratory consists of the following centers:

- Basic Standards²
- Radiation Research
- Chemical Physics
- Analytical Chemistry

The National Engineering Laboratory

Provides technology and technical services to the public and private sectors to address national needs and to solve national problems; conducts research in engineering and applied science in support of these efforts; builds and maintains competence in the necessary disciplines required to carry out this research and technical service; develops engineering data and measurement capabilities; provides engineering measurement traceability services; develops test methods and proposes engineering standards and code changes; develops and proposes new engineering practices; and develops and improves mechanisms to transfer results of its research to the ultimate user. The Laboratory consists of the following centers:

- Applied Mathematics
- Electronics and Electrical Engineering²
- Manufacturing Engineering
- Building Technology
- Fire Research
- Chemical Engineering²

The Institute for Computer Sciences and Technology

Conducts research and provides scientific and technical services to aid Federal agencies in the selection, acquisition, application, and use of computer technology to improve effectiveness and economy in Government operations in accordance with Public Law 89-306 (40 U.S.C. 759), relevant Executive Orders, and other directives; carries out this mission by managing the Federal Information Processing Standards Program, developing Federal ADP standards guidelines, and managing Federal participation in ADP voluntary standardization activities; provides scientific and technological advisory services and assistance to Federal agencies; and provides the technical foundation for computer-related policies of the Federal Government. The Institute consists of the following centers:

- Programming Science and Technology
- Computer Systems Engineering

The Institute for Materials Science and Engineering

Conducts research and provides measurements, data, standards, reference materials, quantitative understanding and other technical information fundamental to the processing, structure, properties and performance of materials; addresses the scientific basis for new advanced materials technologies; plans research around cross-country scientific themes such as nondestructive evaluation and phase diagram development; oversees Bureau-wide technical programs in nuclear reactor radiation research and nondestructive evaluation; and broadly disseminates generic technical information resulting from its programs. The Institute consists of the following Divisions:

- Ceramics
- Fracture and Deformation³
- Polymers
- Metallurgy
- Reactor Radiation

¹Headquarters and Laboratories at Gaithersburg, MD, unless otherwise noted; mailing address Gaithersburg, MD 20899.

²Some divisions within the center are located at Boulder, CO 80303.

³Located at Boulder, CO, with some elements at Gaithersburg, MD.

Preface

Standard Reference Materials (SRM's) as defined by the National Bureau of Standards (NBS) are well-characterized materials, produced in quantity and certified for one or more physical or chemical properties. They are used to assure the accuracy and compatibility of measurements throughout the Nation. SRM's are widely used as primary standards in many diverse fields in science, industry, and technology, both within the United States and throughout the world. They are also used extensively in the fields of environmental and clinical analysis. In many applications, traceability of quality control and measurement processes to the national measurement system is carried out through the mechanism and use of SRM's. For many of the Nation's scientists and technologists it is therefore of more than passing interest to know the details of the measurements made at NBS in arriving at the certified values of the SRM's produced. An NBS series of papers, of which this publication is a member, called the NBS Special Publication - 260 Series, is reserved for this purpose.

This 260 Series is dedicated to the dissemination of information on different phases of the preparation, measurement, certification and use of NBS SRM's. In general, much more detail will be found in these papers than is generally allowed, or desirable, in scientific journal articles. This enables the user to assess the validity and accuracy of the measurement processes employed, to judge the statistical analysis, and to learn details of techniques and methods utilized for work entailing the greatest care and accuracy. These papers also should provide sufficient additional information not found on the certificate so that new applications in diverse fields not foreseen at the time the SRM was originally issued will be sought and found.

Inquiries concerning the technical content of this paper should be directed to the author(s). Other questions concered with the availability, delivery, price, and so forth, will receive prompt attention from:

Abstract

This publication is a summary of the biological and botanical Standard Reference Materials and Research Materials issued by the National Bureau of Standards. The material, composition, certification, use, and remarks concerning each of the ten materials described are presented in tabular form. Copies of the Certificates of Analysis for these materials are contained in the appendix for more detailed information.

Key Words: Biological materials; botanical materials;
chemical compositions; Research Material;
Standard Reference Material.

Introduction

Since its inauguration in 1901, the National Bureau of Standards (NBS) has issued nearly 2000 different Standard Reference Materials (SRM's). Many of these have been renewed several times, many have been replaced or discontinued as technology changed. Today, over 900 SRM's are available, together with a large number of scientific publications related to the fundamental and applied characteristics of these materials. Each material is certified for chemical composition, chemical properties, or its physical or mechanical characteristics. Each SRM is provided with a Certificate or Certificate of Analysis that contains the essential data concerning its properties or characteristics. The SRM's currently available cover a wide range of chemical, physical, and mechanical properties, and a corresponding wide range of measurement interests in practically all aspects of fundamental and applied science. These SRM's constitute a unique and invaluable means of transferring to the user accurate data obtained at NBS, and provide essential tools that can be used to improve accuracy in practically all areas where measurements are performed.

In addition to SRM's, the National Bureau of Standards issues a variety of Research Materials (RM's) having various properties described in individual "Reports of Investigation." They are intended primarily to further the scientific or technical research on that particular material. Other materials, called Special Reference Materials (GM's), are also available from NBS. These are materials produced and certified by other Government agencies, standard organizations, or other nonprofit organizations, that are considered useful to the public and for which no alternate method of national distribution exists.

The various categories of materials available from NBS are given in Table 1. This table lists these materials according to their chemical composition, physical properties, or engineering characteristics. A more detailed alphabetic enumeration of these materials is given in Appendix I. Table 1 and Appendix I were taken from NBS Special Publication 260, NBS Standard Reference Materials Catalog, 1984-85 Edition¹. This publication lists every material available from the NBS Office of Standard Reference Materials.

Further information on the reference materials available from NBS may be obtained from the Office of Standard Reference Materials, National Bureau of Standards, Gaithersburg, MD 20899. Information on other NBS services may be obtained from the Technical Information and Publications Division, National Bureau of Standards, Gaithersburg, MD 20899.

In addition to these types of materials, NBS provides many additional services. These include: Measurement Assurance Programs, Calibration and Related Measurement Services, Proficiency Sample Programs, a National Voluntary Laboratory Accreditation Program, Standards Information Services, Standard Reference Data, and Technical Information and Publications.

¹For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, under Stock No. 003-003-02558-5 (Price \$5.50, add 25 percent for foreign orders.)

CERTIFIED CHEMICAL COMPOSITION STANDARDS

Steels (chip form)	Gases in Metals
Plain carbon	High-Purity Metals
Low alloy	Electron Probe Microanalytical Standards
High alloy	Primary, Working, and Secondary
Stainless	Standard Chemicals
Tool	Microchemical Standards
Steels (granular form)	Clinical Laboratory Standards
Steels (solid form)	Biological Standards
Ingot iron and low alloy	Environmental Standards
Special ingot irons and low alloy	Analyzed gases
Stainless	Analyzed liquids and solids
Specialty	Permeation tubes
High-temperature alloys	Steelmaking Alloys
Tool	Cast Irons (chip form)
Cast Irons (chip form)	Cast Steels, White Cast Irons, Ductile
Cast Steels, White Cast Irons, Ductile	Irons, and Blast Furnace Irons
Irons, and Blast Furnace Irons	(solid form)
(solid form)	Nonferrous Alloys (chip form)
Nonferrous Alloys (chip form)	Aluminum "Benchmarks"
Aluminum "Benchmarks"	Cobalt
Cobalt	Copper
Copper	Copper "Benchmarks"
Copper "Benchmarks"	Lead
Lead	Magnesium
Magnesium	Nickel
Nickel	Nickel Superalloy, Trace Elements
Nickel Superalloy, Trace Elements	Nickel oxide
Nickel oxide	Selenium
Selenium	Tin
Tin	Titanium
Titanium	Zinc
Zinc	Zirconium
Zirconium	Nonferrous Alloys (solid form)
Nonferrous Alloys (solid form)	Aluminum "Benchmarks"
Aluminum "Benchmarks"	Copper
Copper	Copper "Benchmarks"
Copper "Benchmarks"	Lead
Lead	Nickel
Nickel	Titanium
Titanium	Zinc
Zinc	Zirconium
Zirconium	Gases in Metals
	High-Purity Metals
	Electron Probe Microanalytical Standards
	Primary, Working, and Secondary
	Standard Chemicals
	Microchemical Standards
	Clinical Laboratory Standards
	Biological Standards
	Environmental Standards
	Analyzed gases
	Analyzed liquids and solids
	Permeation tubes
	Industrial Hygiene Standards
	Forensic Standards
	Hydrocarbon Blends
	Metallo-Organic Compounds
	Fertilizers
	Ores
	Minerals, Refractories, Glasses, and
	Carbides
	Cement
	Trace Element Standards
	Nuclear Materials
	Special nuclear materials
	Plutonium assay
	Plutonium isotopic
	Uranium assay
	Uranium isotopic
	Neutron density standards
	Fission track glass standards
	Isotopic Reference Standards

Table 1. continued.

CERTIFIED PHYSICAL PROPERTY STANDARDS

Ion Activity Standards

pH standards
pD standards
Ion selective electrodes

Optical Standards

Spectrophotometric
Thermal emittance
Refractive index

Mechanical and Metrology Standards

Magnification
Coating thickness
Glass
Elasticity
Density
Polymer
Rheology

Radioactivity Standards

Alpha-particle standards
Beta-particle and gamma-ray gas standards
Alpha-particle, beta-particle, gamma-ray, and electron-capture solution standards
Contemporary standard for carbon-14 dating laboratories
Environmental standards
Low energy photon sources
Gamma-ray "point-source" standards
Radium gamma-ray solution standards
Radium solution standards for random analysis
Radioactivity standard reference materials currently not in stock

Heat Standards

Superconductive thermometric fixed point devices
Freezing Points

Defining fixed points
Determined reference points

Melting points
Calorimetric

Combustion
Solution
Heat source
Enthalpy and heat capacity

Vapor pressure
Thermal expansion
Thermocouple materials
Thermal resistance

Magnetic Standards

Magnetic susceptibility
Magnetic moment
Paramagnetic resonance

Metallurgical

Mössbauer

X-ray Diffraction

Gas Transmission

Permittivity

Reference Fuels

Resistivity

ENGINEERING TYPE STANDARDS

Standard Rubber and Rubber-Compounding Materials

Reference Magnetic Tapes

Centerline Drawings, OCR-B

Sizing Standards

Glass spheres for particle size
Turbidimetric and fineness (cement)

RESEARCH MATERIALS

X-ray and Photographic Standards

Surface Flammability Standards

Smoke Density Chamber Standards

Water Vapor Permeance

Tape Adhesion Testing Standards

Color Standards

SPECIAL REFERENCE MATERIALS

Biological and Botanical Standards

The first NBS biological and botanical Standard Reference Material designed specifically for the analytical laboratory use was issued in January 1971. This standard, SRM 1571, Orchard Leaves, was developed in response to requests from numerous analytical chemists.

Since then, the number of biological and botanical SRM's has grown to 10, and during the next decade this growth is expected to continue at much the same rate.

This publication is an attempt to describe in general terms the composition, certification, and use of these biological and botanical SRM's.

Table 2 contains the essential information concerning the material, composition, the certification parameters, and use. Under "Remarks," additional data such as storage conditions and stability is provided.¹ All the data and information contained in this table were extracted from the Certificates of Analysis issued for the SRM's included in the table. An examination of this table gives the reader a general view of these SRM's. For more detailed information, the individual certificates reproduced in Appendix II should be consulted as well as the references cited in each certificate.

A summary of the quantitative distribution of the 47 chemical elements determined in the 9 Standard Reference Materials and 1 Research Material from Table 2 is presented in Table 3. The values with an asterisk are expressed in wt. %, the others are expressed in $\mu\text{g/g}$, and the data in parantheses are non-certified values.

The certificates in Appendix II are arranged in numerical order. The SRM's listed in the table include all of the biological and botanical standards that were issued or were in preparation by the end of 1984. These SRM's are the result of the concerted efforts of a number of scientists from the NBS National Measurement Laboratory as well as those from cooperating institutions. Each certificate lists the individuals who contributed to the certification of the SRM.

In addition to the SRM's and their certificates, NBS issues a series of Special Publications (SP), called the "260 Series," that relate directly to Standard Reference Materials as stated in the Preface. The list of available publications in the "260 Series" is given in the beginning of this publication.²

Other NBS publications, not in the "260 Series," and a number of NBS staff authored papers have been published that deal with specific SRM's or measurement techniques. Some of these are: SP 148, The Role of Standard Reference Materials in Measurement Systems; SP 378, Accuracy in Spectrophotometry and Luminescence Measurements (255 pp., 1973); and SP 466, Standardization in Spectrophotometry and Luminescence Measurements (150 pp., 1977), contains papers of interest to analytical chemists. Another publication that should be of particulate interest to the users of the SRM's described in Table 2 is SP 492, "Procedures Used at the National Bureau of Standards to Determine Selected Trace Elements in Biological and Botanical Materials."

This work consists of a collection of analytical procedures used in the Center for Analytical Chemistry, National Measurement Laboratory of the National Bureau of Standards for the determination of trace levels of Ag, Al, As, Be, Bi, Ca, Cd, Cr, Cu, Fe, Hg, K, Mg, Mn, Mo, Na, Ni, Pb, Pt, Sb, Se, Te, Tl, V, and Zn in biological and botanical materials. These procedures were critically selected or adapted, and often specially developed, by the scientific staff members of the Center for Analytical Chemistry to provide measurements with the best obtainable accuracy. They were considered to be most appropriate for the analysis and certification of various Standard Reference Materials issued by NBS such as SRM 1577a, Bovine Liver, SRM 1567, Wheat Flour, etc.

The description of these procedures is given with sufficient detail to permit the analyst to use them as a protocol for routine analyses in the laboratory.

They are assembled according to the analytical disciplines involved in the measuring process: sample preparation, neutron activation analysis, spark source mass spectrometric isotope dilution, atomic absorption and flame emission spectrometry, molecular absorption spectrometry, fluorescence spectrometry, and polarography.

Special Publication 492 contains also a detailed description of the methods and instrumentation used to produce high-purity reagents, including the analytical techniques used to test their purity.

The important subject of blanks, a determining factor common to all analytical measurements, is examined including a detailed description of the environmental conditions necessary to control this essential factor, and to insure a maximum protection against contamination.

The lyophilization method for preconcentration and drying of various analytical samples is also discussed in this work.

The analytical procedures assembled in these publications are believed to provide the best measuring capabilities available at this time. They are, however, continuously being revised, improved, or replaced by more accurate ones.

Hence, it is recommended that the analyst who desires to be informed of these advancements maintain a contact with the scientific staff of the Center for Analytical Chemistry at NBS.

Another work, NBS Special Publication 422, "Accuracy in Trace Analysis: Sampling, Sample Handling, Analysis," Vol. I and II, P. D. LaFleur, Editor, issued in 1976 as a proceeding of the 7th Materials Research Symposium held at NBS in 1974, contains valuable information on the subject, to the analytical chemist.

¹NOTE: The use of proprietary designations in Table 2 is for information only, and should not be construed as an endorsement of the product by either the Department of Commerce or the National Bureau of Standards.

²For complete bibliographic reference and ordering information, see "Other NBS Publications in This Series," pp. iv.

Table 2. Summary of the Biological and Botanical Standards

SRM	Material	Composition
RM50 Albacore Tuna	Tuna fish muscle tissue from albacore tuna caught in the San Diego, California area. It was frozen, ground, mixed, lyophilized, ground again, placed in polyethylene bags, and canned under nitrogen. To improve homogeneity the material was reground, re-blended and recanned.	Minor elements: K 1.22%, Na 0.11%. Trace elements (ppr): Hg 0.95; Se 3.6; Zn 13.6; As 3.3; Pb 0.46; Mn 1.3. Organic constituents (ppm): heptadiene 0.6; toluene 0.7; limonene 0.4; 2-nonanone 0.7; 2-undecanone 0.1; 2,6-di- <i>t</i> -butyl- <i>p</i> -cresol 1.0; hexadecane, trace; heptadecane, trace; pristane, 0.03.
1549 Non-Fat Milk Powder	This material was obtained from a commercial source as a portion of a single lot. The moisture content of the material was reduced to a low level by the spray process.	Certified constituents: (wt. %) Ca 1.30; Cl 1.09; Mg 0.120; P 1.06; K 1.69; Na 0.497; S .351; (μ g/g) Cd .0005; Cr .0026; Cu .7; Fe 1.78; I 3.38; Pb 0.019; Mn .26; Hg .0003; Se .11; Zn 46.1. Non-certified values given for 11 elements; also for lactose and ascorbic acid.
1566 Oyster Tissue	The oysters were obtained by the FDA Bureau of Shellfish Sanitation from a commercial source, frozen in sealed plastic bags. The material was ground, freeze-dried and powdered at the U.S. Army Natick Research & Development Command, Mass., blended and bottled at NBS and freeze-dried again.	Certified minor constituents: Ca 0.15%; Mg 0.128%; K 0.969%; Na 0.51%. Trace constituents (μ g/g): As 13.4; Cd 3.5; Cr 0.69; Cu 63.0; Fe 195; Pb 0.48; Mn 17.5; Hg 0.057; Ni 1.03; Rb 4.45; Se 2.1; Ag 0.89; Sr 10.36; U 0.116; V 2.3; Zn 852. Non-certified information: Cl (1.0%); S (0.76%); P (0.81%); (μ g/g) Br (55); Co (0.4); F (5.2); I (2.8); Mo (<0.2); Tl (<0.005); Th (0.1). Homogeneity was determined by neutron activation and atomic absorption spectrometry on Na, Cl, V, Mn, Mg, K, Cu, Zn, Cd. Calcium exhibits some inhomogeneity.

Certification	Use	Remarks
RM 50 is not an SRM, hence, none of the data presented are certified. For further information see the Report of Investigation describing this Research Material.	RM 50 is intended to be used in the measurement of inorganic and organic chemical species in marine tissue at trace concentrations. It should be useful to scientists interested in evaluating analytical methods and interlaboratory comparisons.	RM 50, sealed in metal cans, should have an indefinite storage life under normal room conditions. The open sample can be kept for 6 months to 2 years in a polyethylene bag at 0 °C.
The analytical methods used in the certification were: atomic absorption spectrometry; atomic emission spectrometry; ion chromatography, isotope dilution mass spectrometry, neutron activation, and photon activation. All measurements are based on a minimum 500 mg of the dried material.	SRM 1549 is intended for use in calibrating instrumentation and evaluating the reliability of analytical methods for the determination of constituents in milk, milk powders, and other biological matrices.	The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation. The bottle should be kept tightly closed and stored in a desiccator in the dark. This certification is invalid after 3 years from date of shipping.
The analytical methods used in the certification were: atomic absorption, flame and spark emission spectrometry, inductively coupled plasma, thermal ionization and isotope dilution, isotope dilution mass spectrometry, spark source mass spectrometry; neutron activation, and polarography. All measurements are based on a minimum 250 mg of the dried material.	SRM 1566 is intended for calibrating instrumentation and validating methodology for the chemical analysis of marine animal tissue for minor and trace elements.	The material should be kept in its original bottle, stored at 10-30 °C in a dark desiccator. Under these conditions it should be stable for 5 years from date of shipping.

Table 2. Biological and Botanical Standards.

SRM	Material	Composition
1567 Wheat Flour	Wheat flour was milled from a blend of Hard Red Spring and Hard Red Winter wheat grown in South Dakota and subjected to 2.5 megarads of Co-60 radiation for microbiological control at Neutron Products, Inc., Dickerson, Md. The material was passed through a sieve with openings of 425 μ m and blended.	Certified minor constituents: K 0.136%; Ca 0.019%. Trace constituents (μ g/g): Fe 18.3; Zn 10.6; Mn 8.5; Na 8.0; Cu 2.0; Se 1.1; Cd 0.032; Hg 0.001. Non-certified information (μ g/g): Br (9); Rb (1); Mo (0.4); Ni (0.18); As (0.006); Te (\leq 0.002). Homogeneity was determined by instrument neutron activation measurements on Mn, K, Zn, Na, and Br.
1568 Rice Flour	Rice flour was prepared from 100% long grain from Arkansas and subjected to 2.5 megarads of Co-60 radiation for microbiological control at Neutron Products, Inc., Dickerson, Md. The material was passed through a sieve with openings of 425 μ m and blended.	Certified minor constituents: K 0.112%; Ca 0.014%. Trace constituents (μ g/g): Mn 20.1; Zn 19.4; Fe 8.7; Na 6.0; Cu 2.2; As 0.41; Se 0.4; Cd 0.029; Co 0.02; Hg 0.0060. Non-certified information (μ g/g): Rb (7); Mo (1.6); Br (1); Ni (0.16); Te (\leq 0.002). Homogeneity was determined by instrumental neutron activation measurements on Mn, K, Zn, Na, and Br.
1569 Brewers Yeast	Yeast was obtained from the Nutrition Institute, U.S. Dept. of Agriculture, Beltsville, Md. It was sieved (0.15 mm) and blended.	Cr, 2.12 ± 0.05 μ g/g determined on the sample without drying and calculated on a dry weight basis. Homogeneity was determined by a neutron activation technique.
1572 Citrus Leaves	The plant material was collected from the Lake Alfred area of central Florida and prepared at Michigan State University. It was air-dried, ground to pass a 425 μ m sieve, dried at 85 °C and mixed. It was sterilized with Co-60 radiation at the U.S. Army Research & Development Command, Natick, Mass.	Certified major and minor constituents (wt. % on dry weight basis): Ca 3.15; Mg 0.58; P 0.13; K 1.82; S 0.407. Trace constituents (μ g/g): Al 92; As 3.1; Ba 21; Cd 0.03; Cr 0.8; Cu 16.5; I 1.84; Fe 90; Pb 13.3; Mn 23; Hg 0.08; Mo 0.17; Ni 0.6; Rb 4.84; Na 160; Sr 100; Zn 29. Non-certified values (μ g/g): Sb (0.04); Br (8.2); Ce (0.28); Cs (0.098); Cl (414); Co (0.02) Eu (0.01); La (0.19); Sm (0.052); Sc (0.01); Se (0.025); Te (0.02) Tl (\leq 0.01); Sn (0.24); U (\leq 0.15); N (2.86 wt. %).

Certification	Use	Remarks
The analytical methods used in the certification were: atomic absorption, flame emission, and isotope dilution spark source mass spectrometry, neutron activation, and polarography. All measurements are based on a minimum 400 mg sample and are reported on a "dry-weight" basis. Selenium and mercury are determined on the material without drying.	SRM 1567 is intended for calibrating instrumentation and evaluating the reliability of analytical methods for the determination of minor and trace elements in wheat flour and similar food products.	The material should be kept in its original bottle, stored at 10-30 °C in a dark desiccator. Under these conditions it should be stable for 5 years from date of shipping.
Same as SRM 1567.	Same as SRM 1567.	Same as SRM 1567.
Chromium was determined by neutron activation and by isotope dilution mass spectrometry. The analyses were performed on the sample without drying and the results expressed on a dry weight basis established on separate samples heated at 85 °C for 3 hrs. The samples should not be dissolved in open vessels.	SRM 1569 is intended for use in calibrating instrumentation and evaluating the accuracy of analytical methods for the determination of chromium in Brewers Yeast and other biological materials containing a volatile chromium component which presents an especially difficult problem.	The material should be kept in its original bottle tightly capped, and stored at 10-23 °C in a dark desiccator.
The analytical methods used in the certification were: atomic absorption and flame emission spectrometry, atomic emission spectrometry using inductively coupled plasma, ion chromatography, isotope dilution thermal source mass spectrometry, isotope dilution spark source mass spectrometry, Kjeldahl method for nitrogen, neutron activation, photon activation, polarography, spectrophotometry.	SRM 1572 is intended for use in calibrating instrumentation and evaluating the analytical methods used for the determination of major, minor, and trace elements in botanical materials, agricultural food products, and similar matrices.	The material should be kept tightly closed in its original bottle, stored in a dark desiccator at a temperature between 10-30 °C. A minimum sample of 500 mg of the dried material should be used for analyses.

Table 2. Biological and Botanical Standards.

SRM	Material	Composition
1573 Tomato Leaves	The leaves were obtained from a field of direct seeded tomatoes at the Horticultural Research Center of the Michigan State University. The air-dried leaves were ground, dried at 85 °C, mixed, packaged in polyethylene-lined drums, and sterilized with Co-60 radiation at the U.S. Army Research & Development Command, Natick, Mass.	Certified major and minor constituents (wt. %): K 4.46; Ca 3.00; P 0.34. Trace constituents (µg/g): Fe 690; Mn 238; Zn 62; Sr 44.9; Rb 16.5; Cu 11; Pb 6.3; Cr 4.5; As 0.27; Th 0.17; U 0.061. Non-certified information, major and minor constituents (wt. %): N (5.0); Mg (0.7); Al (0.12). Trace constituents (µg/g): B (30); Br (26); Cd (3); Ce (1.6); La (0.9); Co (0.6); Sc (0.13); Hg (0.1); Tl (0.05); Eu (0.04). Homogeneity was evaluated by determining P, Fe, Mn, Zn, Rb, Cu, Cr, As, and U.
1575 Pine Needles	Collected from the Manistee State Park, Mich., Air-dried, ground, and dried again at 85 °C. It was mixed, passed through a 0.25 mm sieve, packaged in polyethylene drums, and sterilized with Co-60 radiation at the U.S. Army Research & Development Command, Natick, Mass.	Certified minor elements: Ca 0.41%; K 0.37%; P 0.12%. Trace constituents (µg/g): Mn 675; Al 545; Fe 200; Rb 11.7; Pb 10.8; Sr 4.8; Cu 3.0; Cr 2.6; As 0.21; Hg 0.15; Th 0.037; U 0.020. Non-certified information: N (1.2%); and Br (9); Ni (3.5) Ce (0.4); Cd (<0.5); Sb (0.2); La (0.2); Co (0.1); Tl (0.05); Sc (0.03); Eu (0.006) µg/g. Homogeneity was established by determining P, Al, Fe, Mn, Rb, Cu, Cr, As, Hg, U, K, Ca, Sr, Pb, and Th.
1577a Bovine Liver	The liver was obtained in the Portland, Oregon area. It was ground, mixed, and lyophilized in polyethylene trays by Oregon Freeze Dry Food Inc., Albany, Oregon. The material was then powdered and packaged in moisture-proof bags.	Certified elements (wt. %): Cl 0.28; P 1.11; K 0.996; Na 0.243; S 0.78. Trace elements (µg/g): As 0.047; Cd 0.44; Ca 120; Co 0.21; Cu 158; Fe 194; Pb 0.135; Mg 600; Mn 9.9; Hg 0.004; Mo 3.5; Rb 12.5; Se 0.71; Ag 0.04; Sr 0.138; U 0.00071; V 0.099; Zn 123. Non-certified information: N (10.7 wt. %); and (µg/g); Al (2); Sb (0.003), Br (9); Tl (0.003). Homogeneity was tested by analyzing randomly selected samples and found to be satisfactory.

Certification	Use	Remarks
<p>The analytical methods used in the certification were: atomic absorption and optical emission spectroscopy, isotope dilution and spark source mass spectrometry, Kjeldahl, neutron activation, nuclear track technique, spectrophotometry, polarography. A minimum of 500 mg of the dried material should be used for the analysis.</p>	<p>SRM 1573 is intended for calibrating instrumentation and validation of analytical methods for the determination of major, minor, and trace elements in botanical materials and other agricultural products.</p>	<p>The material should be kept in the original bottle stored at 10-30 °C in a dark desiccator. Under these conditions SRM 1573 should be stable for 5 years after shipping date.</p>
<p>The analytical methods used in the certification were: atomic absorption spectroscopy, isotope dilution mass spectrometry, isotope dilution spark source mass spectrometry, Kjeldahl method, neutron activation, nuclear track technique, optical emission spectroscopy, spectrophotometry, polarography. A minimum of 500 mg of the dried material should be used for the analysis.</p>	<p>Same as SRM 1573.</p>	<p>Same as SRM 1573.</p>
<p>The analytical methods used in the certification were: atomic absorption and flame emission spectrometry, ion chromatography, inductively coupled plasma emission spectrometry, isotope dilution thermal and spark source mass spectrometry, Kjeldahl method for nitrogen, neutron activation, polarography, and spectrophotometry. A minimum of 250 mg of the dried material should be used for the analysis.</p>	<p>SRM 1577a is intended for calibration of instrumentation and validation of methods in the chemical analysis of animal tissue for major, minor, and trace elements.</p>	<p>Same as SRM 1573.</p>

Report of Investigation

Research Material 50

Albacore Tuna

P. D. LaFleur and W. P. Reed

A lyophilized (freeze-dried) marine biological tissue sample has been prepared in an attempt to satisfy many of the analytical requirements for a base line marine reference material.

Tuna fish muscle tissue was chosen for this purpose because of availability, use as a fish foodstuff, and its oceanographic interest.

The tuna is available as a Research Material (RM), in sets of two cans. Each can contains approximately 35 grams of lyophilized tuna tissue in a polyethylene bag, inside the hermetically-sealed, nitrogen filled can.

Material Application

This particular RM is intended to be used in the measurement of elements present at trace concentrations. In addition, some measurements of trace hydrocarbons have been made. The material represents a typical marine tissue that has been lyophilized. It should prove useful to those scientists who may wish to evaluate analytical methods, or to use a generally available "real" sample matrix in interlaboratory comparisons. It is important to note, however, that this is not a Standard Reference Material and none of the data presented here are certified. For the convenience of the analyst using this material, we have included a discussion for each component reported. It is apparent that there is significant heterogeneity for some elements, specifically the "bone-seeking" elements. The homogeneity of other elements appears to be acceptable. In most instances the heterogeneity of the material is observed between samples from the same can. There is some evidence that this heterogeneity is due primarily to fine particles of cartilage or bone present with the tissue in this RM.

Material Preparation

The tuna tissue used in this research material is from albacore tuna caught in the San Diego area in July of 1971. The tuna was cleaned, filleted, frozen and transported to a lyophilization facility. It was thawed, ground, and mixed using stainless steel equipment. For the final mixing, the entire lot was held in a single stainless steel container. The tuna was then lyophilized in aluminum trays lined with polyethylene. After lyophilization, the material was again ground in a stainless-steel mill, carefully transferred to new, individual polyethylene bags, and canned under nitrogen for storage.

Preliminary studies performed on these canned samples raised serious problems about the homogeneity of the material. In an effort to improve this condition the material was reground, rebled and recanned under the same conditions, as before. Except where stated, all measurements provided in this report were made on the reprocessed material. During the second regrinding, fibrous material tended to "float" to the top due to the action of the mixer. This material was discarded.

(over)

Material Use

The lyophilized tuna tissue, sealed in metal cans, should have an indefinite storage life under normal room conditions. Thus far, no evidence exists to indicate deterioration of the material with time as long as the can remains sealed. Once opened, the possibility exists that the raw material will turn rancid. Researchers using only a portion of the material have successfully stored the remainder by placing the polyethylene bag in a glass jar with lid and storing at or below 0°C. A shelf life of 6 months is not unusual under these circumstances and a 2 year stability has been reported. The freeze-dried material represents only about 30% of the original weight of the tuna tissue. Consequently, for direct comparisons with fresh tissue the researcher may wish to adjust the sample weight for this difference. Please note, however, that all values in this "Report of Investigation" are based on the lyophilized weight of the tuna tissue.

The dissolution of this material is not difficult and researchers have reported using a variety of techniques. These techniques include nitric and perchloric acid digestion, nitric-sulfuric-perchloric (4:1:1) acid digestion, low temperature ashing, and oxygen combustion. Because of the apparent presence of small bits of cartilage and/or bone in the sample, the sample size for analysis should be 250 mg or greater to obtain reproducible results. For "bone-seeking" elements (e.g., Pb, U, Ca, Sr) the sample may be nonhomogeneous even with much larger sample sizes.

For the elements listed below, sufficient analytical work has been performed to permit some evaluation of the data. These brief evaluations are not certified values, but only judgments as to the amount of the element present. Problems encountered by analysts making these measurements are also described.

Mercury

The question of the mercury content of various foodstuffs has been studied by many investigators. It is hoped that this material will provide a base line RM for environmental studies of mercury in food. A value of 0.95 ± 0.1 ppm encompasses the means of all of the reported values for mercury with one exception and extensive studies have indicated good homogeneity for this element.

Agreement among methods appears to be good. The data show very little bias among the three methods used. Sample sizes for these measurements have been 0.25 grams and larger.

The question of volatile mercury was explored by one investigator who reported the mercury content decreasing after opening the container. This decrease amounted to approximately 0.1 ppm over a period of 3 weeks after opening even though stored at -25 °C. This work has not been confirmed. Further work by several investigators has suggested that 80-90% of the mercury content is present as methylmercury.

Selenium

This element was determined by four laboratories using both neutron activation analysis and atomic absorption spectroscopy. The range of reported values (\bar{x}) is from 3.27 to 4.01 ppm. A most probable value is 3.6 ± 0.4 . There has been very little indication of heterogeneity for this element.

Zinc

The analysis for zinc was performed by three laboratories using two analytical methods, neutron activation analysis and atomic absorption analysis. The range of mean values (\bar{x}) is 11.4 to 14.6 ppm. Our estimate of the probable value is 13.6 ± 1 ppm. No random behavior has been noted in the analysis of this element.

Arsenic

The analysis for arsenic was performed by 4 laboratories using both neutron activation and atomic absorption techniques. Data obtained within each laboratory appears to be consistent, although there appears to be some disagreement among laboratories analyzing for this element. The range of average values (\bar{x}) between laboratories is 2.74 to 4.6 ppm. The recommended value for the arsenic content is 3.3 ± 0.4 ppm.

Lead

There is a limited amount of data available for lead. The average value is 0.46 ppm. The homogeneity of the material for this element is questionable and the range of individual values is quite large. The use of this Research Material as a control, or for the development of methods for lead cannot be recommended. The isotopic composition, however, has been determined and is: ^{208}Pb 52.2%; ^{207}Pb 21.5%; ^{206}Pb 24.9%; and ^{204}Pb 1.38%.

Other Elements

Manganese was found to be distributed homogeneously and the measured value in the original lot of tuna (not the reblended material) was 1.3 ppm. Sodium also was found to be homogeneous in the original lot of material and the reported value was 0.11%.

Potassium was found to be distributed homogeneously and the measured value on the original lot of tuna (not the reblended material) was 1.22%. The following elements have been found to be heterogeneously distributed in the tuna tissue: uranium, thorium, calcium, and strontium.

Organic Materials

The tuna research material was subjected to headspace sampling and analysis. The concentrations given in the following table are to be considered only as order-of-magnitude estimates of the hydrocarbon compounds present, as they were calculated relative to the amount of naphthalene added to the sample and most of the compounds identified were not aromatic hydrocarbons.

The value for the largest constituent, 2,6-di-t-butyl-p-cresol, is an especially poor estimate. However, this compound is interesting because it is a common antioxidant used in food packaging. It probably has its origins in one of the handling steps between tuna collection and packaging in plastic. An indication of petroleum pollution in the tuna sample comes from the aliphatic hydrocarbons present.

The identification of the monoterpene, limonene, is reasonably certain. As with pristane this compound is composed of isoprene units, but limonene is generally considered to be a product of plant biosynthesis. Its origin in this sample is uncertain, but it may arise from plant material ingested by tuna.

Identification and Approximate Quantitation of Major Isolated Organic Constituents

<u>Compound Identification*</u>	<u>Amount Present (ppm)</u>
Heptadiene (?)	0.6
Toluene	0.7
Limonene	0.4
2-nonanone (?)	0.7
2-undecanone (?)	0.1
2,6-di-t-butyl-p-cresol	1.0
Hexadecane	trace
Heptadecane	trace
Pristane	0.03

*Identification followed by a (?) is probable but not definite.

Summary

The analytical values presented in this report represent the authors' evaluation of a considerable amount of data. For many elements where the reports were inconclusive, probable values are not given. If more information becomes available in the future, this report will be updated. Your help in reporting data will be appreciated.

Certificate of Analysis

Standard Reference Material 1549

Non-Fat Milk Powder

This Standard Reference Material (SRM) is intended primarily for use in calibrating instrumentation and evaluating the reliability of analytical methods for the determination of constituents in milk, milk powders, and other biological matrices.

Certified Values of Constituents: The certified concentrations of the constituent elements are shown in Table 1. Certified values are based on results obtained by definitive methods of known accuracy; or alternatively, from concordant results by two or more independent analytical methods.

Additional Information on Composition: Noncertified concentrations of additional constituent elements are given for information only in Table 2. Noncertified concentrations of lactose and ascorbic acid were determined by high performance liquid chromatography; and for lactose only, by nuclear magnetic resonance.

Notice and Warnings to Users:

Expiration of Certification: This certification is invalid after 3 years from the date of shipping. Should it become invalid before then, purchasers will be notified by NBS.

Stability: The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation. The bottle should be kept tightly closed and stored in a desiccator in the dark.

Use: A minimum sample of 500 mg of the dried material (see Instructions for Drying) should be used for any analytical determination to be related to the certified values of this certificate.

Dissolution procedures should be designed to effect complete dissolution, but without losses of volatile elements, such as mercury. Dissolution for these determinations should be carried out in a closed system.

Statistical consultation was provided by K.R. Eberhardt of the Statistical Engineering Division.

The overall direction and coordination of the analyses were under the chairmanship of E.L. Garner, Chief of the Inorganic Analytical Research Division, and W.E. May, Chief of the Organic Analytical Research Division.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by R. Alvarez.

Notes: (1.) Analytical values are based on the "dry-weight" of material (see Instructions for Drying).

- (2.) Except for Fe, the stated uncertainty includes the union of 95% confidence intervals computed separately for each analytical method. It includes the effects of measurement error, possible effects of known systematic errors, and between-method differences. The uncertainty for Fe is given as a 95% confidence interval for the weighted mean of the mass spectrometric and neutron activation values, and includes an allowance (added linearly) for systematic error in the methods. The weights were chosen to minimize the estimated mean squared error of the weighted mean, as described in "Approximately Linear Models," by J. Sacks and D. Ylvisaker, *Annals of Statistics* 6, pp. 1122-1137, 1978.

National Bureau of Standards

Certificate of Analysis

Standard Reference Material 1566

Oyster Tissue

This Standard Reference Material is intended primarily for use in calibrating instrumentation and validating methodology for the chemical analysis of marine animal tissue.

Certified Values of Constituent Elements: The certified values for the constituent elements are shown in Table 1. Certified values are based on results obtained by reference methods of known accuracy; or alternatively, from results obtained by two or more independent and reliable analytical methods. Non-certified values are given for information only in Table 2. All values are based on a minimum sample size of 250 mg of the dried material.

NOTICE AND WARNINGS TO USERS

Expiration of Certification: This certification is invalid after 5 years from the date of shipping. Should it become invalid before then, purchasers will be notified by NBS.

Storage: The material should be kept tightly closed in its original bottle and stored in a desiccator at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation, including ultraviolet lamps or sunlight.

Use: A minimum sample weight of 250 mg of the *dried* material (see Instructions for Drying) is necessary for any certified value in Table 1 to be valid within the stated uncertainty. The bottle should be shaken well before each use, and closed tightly immediately after use.

The statistical analysis of the data was performed by K. R. Eberhardt and H. H. Ku of the Statistical Engineering Division.

The overall direction and coordination of the analytical chemistry measurements leading to this certificate were performed in the NBS Center for Analytical Chemistry by P. D. LaFleur.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by R. Alvarez.

Office of Standard Reference Materials

(over)

Instructions for Drying: Before weighing, samples of SRM 1566 should be dried to constant weight by one of the following procedures:

1. Reduced-pressure drying at room temperature for 48 hours over $\text{Mg}(\text{ClO}_4)_2$ in a vacuum desiccator at approximately 1.3×10^{-4} Pa (100 nm Hg).
2. Vacuum drying at room temperature for 24 hours at a pressure of approximately 30 Pa (0.2 mm Hg) using a cold trap.
3. Freeze drying for 20 hours at a pressure of approximately 3 Pa (0.02 mm Hg).

Source and Preparation of Material: The oysters for this reference material were obtained by the FDA Bureau of Shellfish Sanitation from a commercial source. They had been shucked, frozen, and packaged in sealed plastic bags. The oyster material was ground, freeze-dried, and powdered at the U.S. Army Natick Research and Development Command, Natick, Mass., under the direction of L. Hinnegardt and G. C. Walker. At NBS, preliminary analyses of the material homogeneity indicated that an improvement in homogeneity would be required to establish more reliable certified values for a minimum sample size of 250 mg. Accordingly, the material was cryogenically ground by J. R. Moody and J. Matwey. It was then blended and bottled at NBS, after which it was again freeze-dried at the Natick, Mass., laboratory.

Homogeneity Assessment: Randomly selected bottles of SRM 1566 were sampled and tested for homogeneity by neutron activation and atomic absorption spectrometry. No inhomogeneity was observed for the following elements determined by neutron activation: Na, Cl, V, and Mn. The values for Mg, K, Cu, Zn, and Cd determined by atomic absorption spectrometry were within the imprecision of the method; however, Ca does exhibit some inhomogeneity--approximately 4% relative standard deviation.

2. Based on dry weight. (For drying instructions, see the section of this certificate on Instructions for Drying.)

The estimated uncertainty is given as 95 percent tolerance limits for coverage of at least 95 percent of the measured values of all bottles of SRM 1566. For a given element, the following statement can be made at a confidence limit of 95 percent. "If the concentrations were measured for all bottles, at least 95 percent of these measured values should fall within the indicated limits." The concept of tolerance limits is discussed in Chapter 2, Experimental Statistics, NBS Handbook 91, 1966, and page 14, The Role of Standard Reference Materials in Measurement Systems, NBS Monograph 148, 1975.

National Bureau of Standards

Certificate of Analysis

Standard Reference Material 1567

Wheat Flour

This Standard Reference Material is intended primarily for calibrating instrumentation and evaluating the reliability of analytical methods for the determination of minor and trace elements in wheat flour and similar agricultural food products.

Certified Values of Constituent Elements: The certified values for the constituent elements are shown in Table 1. They are based on results obtained by two or more independent, reliable analytical methods. Non-certified values which are given for information only, appear in Table 2.

All values are based on a minimum sample size of 400 mg and are reported on a "dry-weight" basis.

Notice and Warnings to Users:

Expiration of Certification: This certification will be invalid after 5 years from the date of shipping. Should it be invalidated before then, purchasers will be notified by NBS.

Storage: The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation, including ultraviolet lamps or sunlight. Ideally, the bottle should be kept in a desiccator in the dark at the temperature indicated.

Use: The following procedures should be followed to relate the analytical determinations to the values reported in this Certificate. The bottle should be shaken well before each use, and a minimum sample of 400 mg of the material should be used. Selenium and mercury should be determined in the material without drying and the concentration values adjusted for the moisture content of the material using separate samples. Other elements may be determined either on samples without drying as indicated above or on samples vacuum-dried for 24 hr as indicated under "Instructions for Drying."

The overall direction and coordination of the technical measurements leading to this Certificate were performed under the chairmanship of H. L. Rook.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by R. Alvarez.

Manganese	8.5 ± 0.5	Cadmium	0.032 ± 0.007
Sodium	8.0 ± 1.5	Mercury	0.001 ± 0.0008

^aAnalytical values are based on the "dry-weight" of material (see Instructions for Drying). Selenium and mercury should be determined on samples without drying and the results adjusted to a "dry-weight" basis by determining moisture on separate samples.

^bThe estimated uncertainty is based on judgment and represents an evaluation of the combined effects of method imprecision, possible systematic errors among methods, and material variability for samples 400 mg or more. (No attempt was made to derive exact statistical measures of imprecision because several methods were involved in the determination of the constituents).

Table 2. Non-certified Values for Constituent Elements^a

NOTE: The values shown in this table are not certified because they are not based on the results of two or more independent reliable methods. These values are included for information only.

Trace Constituents

Element	Content μg/g	Element	Content μg/g
Bromine	(9)	Nickel	(0.18)
Rubidium	(1)	Arsenic	(0.006)
Molybdenum	(0.4)	Tellurium	(≤0.002)

^aAnalytical values are based on the "dry-weight" of material (see Instructions for Drying).

Preparation of Material: The wheat flour for this Standard Reference Material was described by the supplier as milled from a blend of Hard Red Spring and Hard Red Winter wheat grown primarily in South Dakota. The flour was taken from the mill packer during the middle of a run to obtain homogeneous material. The flour had been bleached and brominated in accordance with standard treatments for commercial bakery use. At NBS, the material was passed through a sieve with openings of 425 μm (No. 40) and blended. The bottled material was then subjected to 2.5 megarads of Co-60 radiation for microbiological control at Neutron Products, Inc., Dickerson, Md.

Homogeneity Assessment: A preliminary evaluation of homogeneity was made by instrumental neutron activation using samples of 150 to 300 mg and counting the activities from radionuclides of Mn, K, Zn, Na, and Br. The homogeneity of other certified elements was evaluated using samples of 400 mg or less with the exception of mercury and calcium for which 500 mg and 1 g, respectively, were used. The uncertainties for the concentrations in Table 1 include these results.

Instructions for Drying: Except for selenium and mercury, elements may be determined on samples which have been dried as follows:

Vacuum-dry the material at approximately 25 °C for 24 hours at a pressure not greater than 70 Pa (0.5 mm Hg) with a cold trap at a temperature of about -30 °C or below.

Se and Hg should be determined on undried samples; other elements may be so determined. However, because the Certificate values are reported on a "dry-weight" basis, the elemental concentrations determined on undried samples should be adjusted for the moisture content of the samples. The moisture content, which was approximately 9% when bottled, should be determined on separate samples by either the vacuum-drying procedure described above or drying the sample in air in an oven at 85 °C for 24 hours. Both of these procedures yielded the same loss in weight. Samples for analysis should not be oven-dried lest elements be lost by volatilization.

Certificate of Analysis

Standard Reference Material 1568

Rice Flour

This Standard Reference Material is intended primarily for calibrating instrumentation and evaluating the reliability of analytical methods for the determination of minor and trace elements in rice flour and similar agricultural food products.

Certified Values of Constituent Elements: The certified values for the constituent elements are shown in Table 1. They are based on results obtained by two or more independent, reliable analytical methods. Non-certified values which are given for information only, appear in Table 2.

All values are based on a minimum sample size of 400 mg and are reported on a "dry-weight" basis.

Notice and Warnings to Users:

Expiration of Certification: This certification will be invalid after 5 years from the date of shipping. Should it be invalidated before then, purchasers will be notified by NBS.

Storage: The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation, including ultraviolet lamps or sunlight. Ideally, the bottle should be kept in a desiccator in the dark at the temperature indicated.

Use: The following procedures should be followed to relate the analytical determinations to the values reported in this Certificate. The bottle should be shaken well before each use, and a minimum sample of 400 mg of the material should be used. Selenium and mercury should be determined in the material without drying and the concentration values adjusted for the moisture content of the material using separate samples. Other elements may be determined either on samples without drying as indicated above or on samples vacuum-dried for 24 hr as indicated under "Instructions for Drying."

The overall direction and coordination of the technical measurements leading to this Certificate were performed under the chairmanship of H. L. Rook.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by R. Alvarez.

Standard Reference Material 1569

Brewers Yeast

This Standard Reference Material is intended for use in calibrating instrumentation and evaluating the accuracy of analytical methods for the determination of chromium in brewers yeast and other biological materials. SRM 1569 and like materials contain a volatile chromium component which presents an especially difficult analytical problem. Care should be taken to avoid its loss; see, "Preparation of Biological Materials for Chromium Analysis," W. R. Wolf and F. E. Greene [1].

*Chromium concentration: $2.12 \pm 0.05 \mu\text{g/g}$

*Calculated on a dry weight basis from determinations made on samples *without drying*. (See "Precautions" below.) A minimum sample size of 150 mg should be used.

The certified value is based on concordant results by independent analytical methods; the uncertainty is estimated from the imprecision of the methods and inhomogeneity of the material.

The overall direction and coordination of the technical measurements leading to this certificate were performed under the chairmanship of L. McClendon.

The technical aspects leading to the preparation, certification and issuance of this material were coordinated through the Office of Standard Reference Materials by R. Alvarez.

[1] Wolf, W. R. and Greene, F. E., Preparation of Biological Materials for Chromium Analysis, Proceedings of the 7th Materials Research Symposium, Accuracy in Trace Analysis: Sampling, Sample Handling and Analysis, NBS Spec. Publ. 422, U. S. Government Printing Office, Washington, D.C. (August 1976).

Washington, D.C. 20234
September 7, 1976

J. Paul Cali, Chief
Office of Standard Reference Materials

(over)

Analyses were performed in the NBS Analytical Chemistry Division by L. McClendon (neutron activation) and by L. Dunstan and E. Garner (isotope dilution, mass spectrometry). Cooperative analyses were also made by W. R. Wolf, Nutrition Institute, U.S. Department of Agriculture, Beltsville, Md.

The material was furnished by the Nutrition Institute, U.S. Department of Agriculture, Beltsville, Md. At NBS, it was passed through a sieve having openings of 0.15 mm (U.S. Series 100 standard sieve) and blended.

Precautions:

(1) The analytical determinations should be made on samples *without drying*. The determinations should be corrected to a dry weight basis by heating separate samples at 85 °C for 3 hr to determine the weight loss.

(2) Samples should not be dissolved in open vessels.

Material Homogeneity was determined by a neutron activation technique using 150-mg random samples from bottled material representing different locations of the bulk material. The statistical test pattern was proposed by J. Mandel of the NBS Institute for Materials Research.

Stability:

The material should be kept in its original bottle and stored at temperatures between 10-23 °C. Exposure to moisture should be minimized by tightly capping the bottle immediately after use. Ideally, the bottle should be kept in a desiccator at the temperature indicated.

National Bureau of Standards

Certificate of Analysis

Standard Reference Material 1572

Citrus Leaves

This Standard Reference Material (SRM) is intended primarily for use in calibrating instrumentation and evaluating the reliability of analytical methods for the determination of major, minor, and trace elements in botanical materials, agricultural food products, and similar matrices.

Certified Values of Constituent Elements: The certified values for the constituent elements are shown in Table 1. They are based on results obtained either by definitive methods of known accuracy or by two or more independent analytical methods. Non-certified values, which are given for information only, appear in Table 2.

Notice and Warnings to Users:

Expiration of Certification: This certification is invalid 5 years after the shipping date. Should it be invalidated before then, purchasers will be notified by NBS.

Stability: The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation. Ideally, the bottle should be kept tightly closed in a desiccator in the dark at the temperature indicated.

Use: The bottle should be shaken well before each use. A minimum sample of 500 mg of the dried material (see Instructions for Drying) should be used for any analytical determination to be related to the certified values of this certificate.

Statistical consultation was provided by K. Kafadar of the Statistical Engineering Division.

The overall direction and coordination of the analyses leading to this certification were performed under the chairmanship of E.L. Garner, Chief of the Inorganic Analytical Research Division.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by R. Alvarez.

¹Based on dry weight: For drying instructions, see the section of this certificate on Instructions for Drying. The uncertainties are based on judgment and represent an evaluation of the combined effects of method imprecision, possible systematic errors among methods, and material variability for samples weighing 500 mg or more.

*For those elements determined by definitive methods, the uncertainties are given as 95%/95% statistical tolerance intervals. See The Role of Standard Reference Materials in Measurement Systems, NBS Monograph 148, 1975 p 14.

Table 2. Non-certified Values for Constituent Elements

NOTE: The following values are not certified because they are not based on the results of either a definitive method of known accuracy or two or more independent methods. These values are included for information only.

Major Constituent

<u>Element</u>	<u>Content,¹ (Wt. Percent)</u>
Nitrogen	(2.86)

Trace Constituents

<u>Element</u>	<u>Content,¹ µg/g</u>	<u>Element</u>	<u>Content,¹ µg/g</u>
Antimony	(0.04)	Samarium	(0.052)
Bromine	(8.2)	Scandium	(0.01)
Cerium	(0.28)	Selenium	(0.025)
Cesium	(0.098)	Tellurium ^a	(0.02)
Chlorine	(414)	Thallium	(≤0.01)
Cobalt	(0.02)	Tin	(0.24)
Europium	(0.01)	Uranium	(≤0.15)
Lanthanum	(0.19)		

¹ Analytical values are based on the "dry weight" of material (See Instructions for Drying).

^a Not sufficiently homogeneous for certification.

Instructions for Drying: Samples of this SRM must be dried before weighing and analysis by either of the following procedures:

1. Drying for 2 hours in air in an oven at 85 °C.
2. Drying for 24 hours at 20 to 25 °C and at a pressure not greater than 30 Pa (0.2 mm Hg).

Additional Information on Analyses: This SRM contains siliceous material, which is an integral part of the sample. The values in Tables 1 and 2 are based on analyses performed on the *entire* sample. Therefore, dissolution procedures should be capable of complete dissolution of the sample but should not result in losses of volatile elements, such as arsenic and mercury.

Source and Preparation of Material: The plant material for this SRM was collected and prepared under the direction of A. L. Kenworthy, Michigan State University. Its source was the Lake Alfred area of central Florida. The material was air-dried, ground in a comminuting machine to pass a 425-µm (No. 40) sieve, dried at 85 °C, and thoroughly mixed in a feed blender. After packaging the material in polyethylene-lined fiber drums, it was sterilized in situ with cobalt-60 radiation. The sterilization procedure was carried out at the U.S. Army Research and Development Command, Natick, Mass. under the direction of A. Brynjolfsson.

Certificate of Analysis

Standard Reference Material 1573

Tomato Leaves

This Standard Reference Material is intended primarily for calibrating instrumentation and evaluating the reliability of analytical methods for the determination of major, minor, and trace elements in botanical materials and other agricultural products.

Certified Values of Constituent Elements: The certified values for the constituent elements are shown in Table 1. They are based on results obtained either by reference methods of known accuracy or by two or more independent, reliable analytical methods. Non-certified values, which are given for information only, appear in Table 2. All values are based on a minimum sample size of 500 mg of the material dried as indicated under "Instructions for Drying."

Notice and Warnings to Users:

Expiration of Certification: This certification will be invalid 5 years after the shipping date. Should it be invalidated before then, purchasers will be notified by NBS.

Stability: The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation, including ultraviolet lamps or sunlight. Ideally, the bottle should be kept in a desiccator in the dark at the temperature indicated.

Use: The bottle should be shaken well before each use. A minimum sample of 500 mg of the *dried* material (see Instructions for Drying) should be used for any analytical determination to be related to the certified values of this certificate.

The overall direction and coordination of the technical measurements leading to this certificate were performed under the chairmanship of H. L. Rook. The overall coordination of the cooperative work performed by the Commission of European Communities, Joint Research Center, Ispra Establishment, Italy, was by G. Rossi of the Chemistry Division.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by T. W. Mears and R. Alvarez

Table 1. Certified Values of Constituent Elements^a

Major and Minor Constituents

<u>Element</u>	<u>Content Wt. Percent</u>
Potassium	4.46 ± 0.03
Calcium	3.00 ± 0.03
Phosphorus	0.34 ± 0.02

Trace Constituents

<u>Element</u>	<u>Content μg/g</u>	<u>Element</u>	<u>Content μg/g</u>
Iron	690 ± 25	Lead	6.3 ± 0.3
Manganese	238 ± 7	Chromium	4.5 ± 0.5
Zinc	62 ± 6	Arsenic	0.27 ± 0.05
Strontium	44.9 ± 0.3	Thorium	0.17 ± 0.03
Rubidium	16.5 ± 0.1	Uranium	0.061 ± 0.003
Copper	11 ± 1		

^aAnalytical values are based on the "dry-weight" of material (See Instructions for Drying).

The uncertainties of the values shown in Table 1 include allowances for inhomogeneity, method imprecision, and an estimate of possible biases of the analytical methods used.

Table 2. Non-certified Values for Constituent Elements^a

NOTE: The following values are not certified because they are not based on the results of either a reference method of known accuracy or two or more independent methods. These values are included for information only.

Major and Minor Constituents

<u>Element</u>	<u>Content Wt. Percent</u>
Nitrogen	(5.0)
Magnesium	(0.7)
Aluminum	(0.12)

Trace Constituents

<u>Element</u>	<u>Content μg/g</u>	<u>Element</u>	<u>Content μg/g</u>
Boron	(30)	Cobalt	(0.6)
Bromine	(26)	Scandium	(0.13)
Cadmium ^b	(3)	Mercury	(0.1)
Cerium	(1.6)	Thallium	(0.05)
Lanthanum	(0.9)	Europium	(0.04)

^aAnalytical values are based on the "dry weight" of material (See Instructions for Drying).

^bCadmium was not sufficiently homogeneous for certification.

Instructions for Drying: Samples of this Standard Reference Material *must* be dried before weighing by either of the following procedures:

1. Drying in air in an oven at 85 °C for 2 hours.
2. Lyophilization using a cold trap at or below -50 °C at a pressure *not greater* than 30 Pa (0.2 mm Hg) for 24 hours.

NOTE: Drying either in an oven at 105 °C or in a vacuum oven at 75 °C causes large losses of volatiles other than water and should *not* be used.

Additional Information on Analyses: This Standard Reference Material contains siliceous material, which is an integral part of the sample. The analyses reported in Tables 1 and 2 were performed on the entire sample. Therefore, dissolution procedures should be capable of complete dissolution of the sample, but should not result in losses of volatile elements, such as arsenic and mercury.

Source and Preparation of Material: The plant material for this SRM was collected and prepared under the direction of A. L. Kenworthy of Michigan State University, East Lansing, Mich. Its source was a field plot of direct seeded tomatoes that had been established at the Horticultural Research Center of the University. For the preparation of the SRM, the terminal portions of the plants were clipped, air-dried, and ground in a comminuting machine. After grinding, the material was dried at 85 °C, thoroughly mixed in a feed blender, packaged in polyethylene-lined fiber drums, and sterilized in situ with cobalt-60 radiation. The sterilization procedure was carried out at the U.S. Army Research and Development Command, Natick, Mass. under the direction of A. Brynjolfsson. At NBS, a preliminary evaluation of the material homogeneity indicated that its improvement would be required to establish more reliable certified values. Therefore, the material was resieved and the portion that had passed a polypropylene sieve having openings of 0.25 mm (equivalent to a U.S. series 60 standard sieve) was retained for the SRM.

Homogeneity Assessment: Material homogeneity was evaluated by determining nine of the certified elements, P, Fe, Mn, Zn, Rb, Cu, Cr, As, and U on samples of 500 mg or less taken at various locations of the freeze-dried bulk material. The other certified elements, K, Ca, Sr, Pb, and Th were determined using sample weights not exceeding one gram. The uncertainties of the concentrations given in Table 1 include these results.

National Bureau of Standards Certificate of Analysis

Standard Reference Material 1575

Pine Needles

This Standard Reference Material is intended primarily for calibrating instrumentation and evaluating the reliability of analytical methods for the determination of major, minor, and trace elements in botanical materials and other agricultural products.

Certified Values of Constituent Elements: The certified values for the constituent elements are shown in Table 1. They are based on results obtained either by reference methods of known accuracy or by two or more independent, reliable analytical methods. Non-certified values, which are given for information only, appear in Table 2. All values are based on a minimum sample size of 500 mg of the material dried as indicated under "Instructions for Drying."

Notice and Warnings to Users:

Expiration of Certification: This certification will be invalid 5 years after the shipping date. Should it be invalidated before then, purchasers will be notified by NBS.

Stability: The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation, including ultraviolet lamps or sunlight. Ideally, the bottle should be kept in a desiccator in the dark at the temperature indicated.

Use: The bottle should be shaken well before each use. A minimum sample of 500 mg of the *dried* material (see Instructions for Drying) should be used for any analytical determination to be related to the certified values of this certificate.

The overall direction and coordination of the technical measurements leading to this certificate were performed under the chairmanship of H. L. Rook. The overall coordination of the cooperative work performed by the Commission of European Communities, Joint Research Center, Ispra Establishment, Italy, was by G. Rossi of the Chemistry Division.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by T. W. Mears and R. Alvarez.

Table 1. Certified Values of Constituent Elements^a

Major and Minor Constituents

<u>Element</u>	<u>Content Wt. Percent</u>
Calcium	0.41 ± 0.02
Potassium	0.37 ± 0.02
Phosphorus	0.12 ± 0.02

Trace Constituents

<u>Element</u>	<u>Content μg/g</u>	<u>Element</u>	<u>Content μg/g</u>
Manganese	675 ± 15	Copper	3.0 ± 0.3
Aluminum	545 ± 30	Chromium	2.6 ± 0.2
Iron	200 ± 10	Arsenic	0.21 ± 0.04
Rubidium	11.7 ± 0.1	Mercury	0.15 ± 0.05
Lead	10.8 ± 0.5	Thorium	0.037 ± 0.003
Strontium	4.8 ± 0.2	Uranium	0.020 ± 0.004

^aAnalytical values are based on the "dry-weight" of material (See Instructions for Drying).

The uncertainties of the values of the constituents shown in Table 1 include allowances for material inhomogeneity, method imprecision, and an estimate of possible biases of the analytical methods used.

Table 2. Non-certified Values for Constituent Elements^a

NOTE: The following values are not certified because they are not based on the results of either a reference method of known accuracy or two or more independent methods. These values are included for information only.

Major Constituent

<u>Element</u>	<u>Content Wt. Percent</u>
Nitrogen	(1.2)

Trace Constituents

<u>Element</u>	<u>Content μg/g</u>	<u>Element</u>	<u>Content μg/g</u>
Bromine	(9)	Lanthanum	(0.2)
Nickel	(3.5)	Cobalt	(0.1)
Cerium	(0.4)	Thallium	(0.05)
Cadmium ^b	(<0.5)	Scandium	(0.03)
Antimony	(0.2)	Europium	(0.006)

^aAnalytical values are based on the "dry-weight" of material (See Instructions for Drying).

^bCadmium was not sufficiently homogeneous for certification.

Instructions for Drying: Samples of this Standard Reference Material *must* be dried before weighing by either of the following procedures:

1. Drying in air in an oven at 85 °C for 2 hours.
2. Lyophilization using a cold trap at or below -50 °C at a pressure *not greater* than 30 Pa (0.2 mm Hg) for 24 hours.

NOTE: Drying either in an oven at 105 °C or in a vacuum oven at 75°C causes large losses of volatiles other than water and should *not* be used.

Additional Information on Analyses: This Standard Reference Material contains siliceous material, which is an integral part of the sample. The analyses reported in Tables 1 and 2 were performed on the entire sample. Therefore, dissolution procedures should be capable of complete dissolution of the sample but should not result in losses of volatile elements, such as arsenic and mercury.

Source and Preparation of Material: The plant material for this SRM was collected and prepared under the direction of A. L. Kenworthy of Michigan State University, East Lansing, Mich. Its source was Manistee State Park, approximately 65 km north of Muskegon, Mich. For the preparation of the SRM, the material was air-dried, and ground in a comminuting machine. After grinding the material, it was dried at 85 °C, thoroughly mixed in a feed blender, packaged in polyethylene-lined fiber drums, and sterilized in situ with cobalt-60 radiation. The sterilization procedure was carried out at the U.S. Army Research and Development Command, Natick, Mass. under the direction of A. Brynjolfsson. At NBS, preliminary evaluation of the material homogeneity indicated that its improvement would be required to establish more reliable certified values. Therefore, the material was resieved and the portion that passed a polypropylene sieve having openings of 0.25 mm (equivalent to a U.S. series 60 standard sieve) was retained for the SRM.

Homogeneity Assessment: Material homogeneity was evaluated by determining ten of the certified elements, P, Al, Fe, Mn, Rb, Cu, Cr, As, Hg, and U on samples of 500 mg or less taken at various locations of the freeze-dried bulk material. The other certified elements, K, Ca, Sr, Pb, and Th were determined using sample weights not exceeding one gram. The uncertainties for the concentrations given in Table 1 include these results.

Analytical Methods Used and Analysts

Analytical Methods

- A. Atomic absorption spectroscopy
- B. Isotope dilution mass spectrometry
- C. Isotope dilution spark source mass spectrometry
- D. Kjeldahl method for nitrogen
- E. Neutron activation
- F. Nuclear track technique
- G. Optical emission spectroscopy

Certificate of Analysis

Standard Reference Material 1577a

Bovine Liver

This Standard Reference Material (SRM) is intended primarily for use in calibrating instrumentation and evaluating the reliability of analytical methods for the determination of major, minor, and trace elements in animal tissue and other biological matrices.

Certified Values of Constituent Elements: The certified values for the constituent elements are shown in Table 1. Certified values are based on results obtained by definitive methods of known accuracy; or alternatively, from results obtained by two or more independent analytical methods. Noncertified values are given for information only in Table 2.

Notice and Warnings to Users:

Expiration of Certification: This certification is invalid after 5 years from the date of shipping. Should it become invalid before then, purchasers will be notified by NBS.

Stability: The material should be kept in its original bottle and stored at temperatures between 10-30 °C. It should not be exposed to intense sources of radiation. The bottle should be kept tightly closed and stored in a desiccator in the dark.

Use: A minimum sample of 250 mg of the dried material (see Instructions for Drying) should be used for any analytical determination to be related to the certified values of this Certificate.

Dissolution procedures should be designed to effect complete solution, but without losses of volatile elements, such as mercury. Dissolution for these determinations should be carried out in a closed system.

Statistical consultation was provided by K.R. Eberhardt and T.R. Crichton of the Statistical Engineering Division.

The overall direction and coordination of the analyses leading to this certification were under the chairmanship of E.L. Garner, Chief of the Inorganic Analytical Research Division.

The technical and support aspects involved in the preparation, certification, and issuance of this Standard Reference Material were coordinated through the Office of Standard Reference Materials by R. Alvarez.

Table 1. Certified Values of Constituent Elements

<u>Element</u>	<u>Content,^a (Wt. Percent)</u>
Chlorine	0.28 ± 0.01
Phosphorus	1.11 ± 0.04
Potassium*	0.996 ± 0.007
Sodium	0.243 ± 0.013
Sulfur	0.78 ± 0.01

<u>Element</u>	<u>Content,^a (μg/g)</u>	<u>Element</u>	<u>Content,^a (μg/g)</u>
Arsenic	0.047 ± 0.006	Mercury	0.004 ± 0.002
Cadmium	0.44 ± 0.06	Molybdenum	3.5 ± 0.5
Calcium	120 ± 7	Rubidium*	12.5 ± 0.1
Cobalt	0.21 ± 0.05	Selenium	0.71 ± 0.07
Copper	158 ± 7	Silver	0.04 ± 0.01
Iron	194 ± 20	Strontium*	0.138 ± 0.003
Lead*	0.135 ± 0.015	Uranium*	0.00071 ± 0.00003
Magnesium	600 ± 15	Vanadium*	0.099 ± 0.008
Manganese	9.9 ± 0.8	Zinc	123 ± 8

*Dry weight: For drying instructions, see the section of this Certificate on Instructions for Drying.

The estimated uncertainties are based on judgment and represent an evaluation of the combined effects of method imprecision, possible systematic errors among methods, and material variability for samples weighing 250 mg or more.

*For those elements determined by definitive methods, the uncertainties are given as 95%/95% statistical tolerance limits. See "The Role of Standard Reference Materials in Measurement Systems," NBS Monograph 148, 1975 p 14.

Table 2. Noncertified Values of Constituent Elements

<u>Element</u>	<u>Content,^a (Wt. Percent)</u>
Nitrogen	(10.7)

<u>Element</u>	<u>Content,^a μg/g</u>
Aluminum	(2)
Antimony	(0.003)
Bromine	(9)
Thallium	(0.003)

*Dry weight: For drying instructions, see the section of this Certificate on Instructions for Drying.

Instructions for Drying: Samples of this SRM must be dried before weighing according to the following procedure: Dry for 24 hours at 20 to 25 °C in a vacuum oven at a pressure not greater than 30 Pa (0.2 mm Hg).

Source and Preparation of Material:

The liver for this standard was obtained in the Portland, Oregon, area. The gross fat, major blood vessels, and "skin" were removed and the liver was ground. The ground liver was then mixed, transferred to polyethylene-lined trays, and lyophilized by Oregon Freeze Dry Foods, Inc., Albany, Oregon. After lyophilization, the liver was powdered in a Tornado mill, packaged in moisture-proof bags, and then transported to the National Bureau of Standards.

NBS *Technical Publications*

Periodical

Journal of Research—The Journal of Research of the National Bureau of Standards reports NBS research and development in those disciplines of the physical and engineering sciences in which the Bureau is active. These include physics, chemistry, engineering, mathematics, and computer sciences. Papers cover a broad range of subjects, with major emphasis on measurement methodology and the basic technology underlying standardization. Also included from time to time are survey articles on topics closely related to the Bureau's technical and scientific programs. Issued six times a year.

Nonperiodicals

Monographs—Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

Handbooks—Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications—Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series—Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series—Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NBS under the authority of the National Standard Data Act (Public Law 90-396).

NOTE: The Journal of Physical and Chemical Reference Data (JPCRD) is published quarterly for NBS by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements are available from ACS, 1155 Sixteenth St., NW, Washington, DC 20056.

Building Science Series—Disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes—Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

Voluntary Product Standards—Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The standards establish nationally recognized requirements for products, and provide all concerned interests with a basis for common understanding of the characteristics of the products. NBS administers this program as a supplement to the activities of the private sector standardizing organizations.

Consumer Information Series—Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

Order the above NBS publications from: Superintendent of Documents, Government Printing Office, Washington, DC 20402.

Order the following NBS publications—FIPS and NBSIR's—from the National Technical Information Service, Springfield, VA 22161.

Federal Information Processing Standards Publications (FIPS PUB)—Publications in this series collectively constitute the Federal Information Processing Standards Register. The Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NBS Interagency Reports (NBSIR)—A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Service, Springfield, VA 22161, in paper copy or microfiche form.
